

Features that still need work

Grouped by readiness

Derived from the verified use-case review of the current build. Ordered by how ready each group is to be worked on, not by importance.

1. Known defects

None currently open. Every defect found in this round has been fixed — see **Recently closed**.

2. Built but not yet exercised live

Nothing outstanding — every feature has now been exercised against the live database.

3. Partially built

Nothing outstanding — A8 was the last item here and is now delivered.

4. Open observations — not yet investigated

Observation	Why it matters
The passport rendered two identical "Player of the Week" entries	Either duplicate rows in <code>recognition_awards</code> or a render duplication. Recognition is permanent and shown on the passport, so duplicates are visible to players
~~A U11s squad exists in the data~~ — resolved, and it was not what it looked like	The "U11s" was a coach's free-text <code>team</code> label, not an <code>age_group</code> value. Every <code>squad_players.age_group</code> is NULL, so no sub-U13 data ever existed. The real defect was <code>CoachAddPlayer</code> carrying its own U7–U19+ list separate from <code>AGE_GROUPS</code> , which would eventually have produced exactly that data. Fixed — the screen now reads the shared constant. Decision: the range starts at U13

5. Not built — the character feature

The athlete's only active role, and the reason for a child to open the app between matches. Content is gated on the sports psychologist review.

	Feature	Persona
A13	Per-session moment: learn (flashcard) → apply (scenario) → act (challenge)	Athlete
A14	Growth view: values shown, streaks, season progress	Athlete

N2	Character corner on the player card — separate axis, never merged into the performance band	Athlete
C13	Coach sees a player's character progress	Coach
—	Content library: values × age band × tier, plus the weekly value rotation	—

6. Not built — required before real users or revenue

	Feature
N3	Terms of service and privacy policy
N3	Parental consent capture — age gating, versioning, audit trail
N4	Billing: payments, plans, subscription state, invoices, failed-payment handling
—	Data export for GDPR portability (account deletion already exists)

7. Deliberately deferred

Feature	Note
Parents see the coach's private note	Kept player-only on purpose. Reopen only if you decide otherwise
P6 → parent view of coach assessments	Now delivered; the private note remains excluded
Multi-sport — rugby, basketball	Needs the football pack proven first
School / academy roles	Parked with the schools direction

8. Technical work that is not a feature but blocks launch

Item	Current state
Test coverage	7 test files against 163 source files

RLS security review	Done. Full pass completed — see Security review below
PWA manifest / install experience	Done (18b2fa4). Manifest, icon set and Apple touch icon added — Trak installs to the home screen and opens standalone
Backups	Restore never tested
Bundle size	Build warns on chunks over 500 kB
Coach friction	Partly done. Quick Assess fixed (a282d34). Match logging and add-player not yet measured

Shortest path

There are no open defects. What remains is genuine build work, and the two largest pieces — the character feature and the legal/billing layer — are gated on the psychologist and lawyer conversations rather than on engineering.

Both product questions are now settled — age groups start at U13, and [player_goals](#) is dropped. The most valuable unblocked work is **continuing the coach friction audit** (match logging and add-player), because that targets the biggest risk to the business rather than to the codebase. After that: test coverage, untested backups, bundle size, and the absolute [og:image](#) URL once the production domain is known.

Security review — completed

A full authorization pass was run against the live database, signed in as each role.

Read isolation: clean. Anonymous users can read **zero rows** from every table. A player sees only their own records; a coach sees only their own squad and assessments, nothing from the other two coaches in the academy; a parent probed against **ten other children's** squad rows returned zero assessments and zero awards.

Write authorization: one serious flaw, now fixed ([bf74447](#)). Every write policy on coach-owned tables read **WITH CHECK** ([coach_user_id = auth.uid\(\)](#)) — which asks "are you claiming to be yourself?" but never "are you a coach?". Signed in as an ordinary player it was possible to:

- insert a coach assessment with 10/10 in every category about oneself — feeding the band, Evolution Card, passport, parent view and club dashboard
- award oneself Player of the Week
- insert coach sessions, calendar events and squad players
- create an organization with oneself as admin

Because [coach_assessments](#) and [recognition_awards](#) deliberately have no DELETE policy, the fabricated rows could not be removed through the app either.

Fixed by requiring the writer to actually hold the role ([is_coach\(\)](#), [is_club_admin\(\)](#)) on every INSERT and UPDATE. Verified afterwards that all six attacks are blocked, that coaches can still assess, award, create sessions and events and add players, and that a player joining by invite code still works (that path is **SECURITY DEFINER** and unaffected).

[get_profile_role\(uuid\)](#) was also narrowed to the caller. It was **not** dropped despite appearing unused in the app: it is what the "users can update own profile" policy relies on to stop a user promoting themselves to coach.

Why code review would not have caught this: `coach_user_id = auth.uid()` reads like a correct ownership check. It only failed when the write was actually attempted from the wrong account.

Coach friction — the business risk being worked

The business model matrix names "coach stops logging" as the single biggest threat to the product: the coach does all the work, is usually unpaid, and if the routine takes more than a couple of minutes it stops by week three. If the coach stops, there is nothing for the player, parent or club to see.

Measured and fixed: Quick Assess reset all six sliders to the midpoint for every player — about **108 precise drags** to get through an 18-player squad on a phone. It also invited bad data, since tapping **Next** without touching anything recorded a real "Mixed 5.0" assessment indistinguishable from a considered one. Sliders now start from that player's previous assessment, so the coach moves only what changed. No extra query: the scores were already being fetched and discarded.

Not yet measured: match logging, and the add-player flow.

Recently closed

- **Quick Assess friction** — sliders start from the player's last assessment instead of the midpoint ([a282d34](#)). Verified live.
- **Age groups single-sourced** — `CoachAddPlayer` carried its own U7–U19+ list while signup used the shared constant.

Decision: the range starts at U13 ([aa446c0](#)).

`player_goals` **dropped** — the table behind the removed goals feature. Nothing read it; removed rather than left dormant because it is children's data that would otherwise need declaring ([a1f957d](#)).

PWA install experience — Trak can now be added to a home screen and opens without browser chrome ([18b2fa4](#)). Share previews also fixed: the Open Graph image pointed at a stale Lovable screenshot. **One follow-up:** `og:image` is still relative, and social platforms need an absolute URL — it must be set to the production domain before invite links preview correctly.

P4 parent alerts — verified live and extended with recognition awards as a third alert type, using the parent read access added in [20260612000001](#).

A8 parent invite delivery — built ([5c91efe](#)). Players can now share an invite link from their profile; previously a parent was only linked by coincidence of using the exact address.

P5 — parent access to coach assessments and awards. Migration [20260612000001](#), applied.

- **Housekeeping** — `MatchLog.tsx` and `CoachProgress.tsx` deleted as orphaned and unreferenced.
- **Verification sweep** — C9 recognition, C10 schedule, C11 AI assistant, A7 passport and K6 club radar all exercised live against the database. **None was silently broken** — the P5 pattern did not repeat. C11 proved stronger than documented: it is squad-aware and renders pitch diagrams.
- **K5 club dashboard** — showed "TOTAL PLAYERS 1" above squads summing to 29, because the headline counted linked accounts while the squads counted roster rows. Fixed ([3bd1507](#)).
- **Passport horizontal overflow** — fixed ([866949a](#)); the card now scales to fit while the PNG export keeps its full 390px geometry.
- **Dev seed duplication** — the whole seed is now idempotent ([14976b2](#), [42e43c3](#)).
- **Signup password policy** — client rules did not match Supabase, so realistic passwords were rejected with a raw character-set dump. Fixed ([fd1a30e](#)).
- **End-to-end chain verified** — coach → player → parent created from scratch; invite-code linking, squad membership and parent linking all confirmed against the live database.
