

Trak - Status

Current state, blockers and next steps

Headline

The app has no open defects and no unverified features. Every use case across all four personas — coach, athlete, parent, club admin — has been exercised against the live database and works. That was not true a week ago: the previous assessment described features that had since been removed, and six features had never been run at all.

Done recently

Area	What changed
Security	Full authorization review. Found and fixed a serious flaw: any player could fabricate coach assessments and awards about themselves. Read isolation verified clean for every role, including anonymous
Parent experience	Parents can now see coach assessments and awards (was silently blocked by a missing policy). Recognition now appears in their alerts feed
Parent invites	Players can finally deliver an invite — a shareable link, via the phone's native share sheet. Previously a parent was only linked if they happened to sign up with the exact invited address
Install experience	Trak can now be added to a home screen and opens as an app, not a browser tab. Share previews fixed
Signup	Password rules did not match what the server enforced, so realistic passwords were rejected with a raw error. Fixed across every signup path
Data quality	The dev seed duplicated every match, assessment and award on each run. Made idempotent; existing duplicates cleaned
Correctness	Club dashboard showed "1 player" above squads totalling 29. Passport scrolled sideways on narrow phones

Everything above was verified by running the app, not by reading the code.

What is blocked, and on whom

Item	Waiting on
Character feature — the whole module	Sports psychologist review (in progress)
Company formation, terms, privacy policy, parental consent	Lawyer meeting

Billing	Pricing decision — who pays: club, coach or parent
---------	--

Open decisions

- **Age groups.** The data contains a U11s squad, but the app only offers U13 and up. Extend the range, or remove that squad?
- **player_goals table.** All its code is gone. Drop the table, or leave it?
- **Production domain.** Needed to finish share previews — link previews will not render until the image URL is absolute.

Next up

1. Finish share previews once the domain is confirmed (**small**)
2. Test coverage — 8 test files against 163 source files
3. Backups have never been restore-tested
4. Bundle size — the build warns on chunks over 500 kB
